

Loops=> When we need to repeatedly execute a blocks of statement

- It is used to repeat a section of code known number of times

FOR LOOP=> If the number of iteration is fixed, We use For Loop.

While LOOP=> If the number of iteration is not fixed, We use While Loop.

- It executes the block as long as the condition is true.

DO- While LOOP=> If the number of iteration is not fixed and you must have to execute the loop at least once.

- The condition is evaluated after the code block, so it is guranteed to run at least for once.

- If you want to execute code block and then check condition, in that case we use do-while loop.
